

Vendor Management CRM

Product Requirements Document (PRD)

Purpose

A Vendor Management, Purchase and Payment CRM that centralizes vendor registration, purchase records, payment records, outstanding balances, attachments and graphical analytics. The requirements below are derived from the supplied handwritten product notes and organized into an implementation-ready structure.

1. Vendor Registration

The CRM shall provide a Vendor Registration module for creating, editing and viewing vendor records.

Field	Requirement
Vendor Name	Name of the vendor/company.
Phone No.	Primary vendor contact number.
State	Vendor state.
Town/City	Vendor town or city.
Payment Balance	Current outstanding balance calculated from purchases and payments.
Last Payment	Date/details of the latest payment.

Vendor actions

Add vendor; edit vendor; view vendor details; view purchase history; view payment history; view balance; view vendor analytics/history.

2. Purchase Management

Each vendor shall have a purchase section containing all products/services purchased from that vendor.

Field	Requirement
Brand Name	Product brand.
Model Name	Product/model name.
Quantity	Quantity purchased.
Date	Purchase date.
Unit Price	Price per unit.
Cost / Value	Purchase value.
Attachment	Invoice, bill, receipt or supporting document.
Total	Calculated purchase total.

Calculation: Total = Quantity × Unit Price

Users should be able to upload supporting documents for purchase transactions.

3. Payment Management

The CRM shall maintain a complete payment history for each vendor.

Field	Requirement
Date	Payment date.
Payment Method	Cash, bank transfer, UPI, cheque or other configured method.
Attachment	Payment proof/receipt.
Value Paid	Amount paid to the vendor.

Balance logic: Outstanding Balance = Total Purchase Value – Total Payments Made.

Adding a purchase increases the vendor's outstanding amount; adding a payment decreases it. The UI should clearly indicate the resulting balance/status.

4. Overall Vendor Dashboard — Purchase

A dashboard shall provide an organization-wide view of purchase activity across vendors.

Element	Requirement
Chart	Time-aware graphical representation of purchase values.
X-axis	Vendor names for vendor comparison; time/date can be used for trend views.
Y-axis	Purchase value.
Time Filters	Daily, weekly, monthly, quarterly, yearly and custom range.
Drill-down	Clicking a vendor/record should open the corresponding filtered records or vendor dashboard.

5. Single Vendor Dashboard — Purchase

Users shall be able to select one vendor and view only that vendor's purchase analytics.

Element	Requirement
Vendor Selector	Select a specific vendor.
X-axis	Month/time period.
Y-axis	Purchase value.
Purpose	Analyze purchase trends for the selected vendor over time.

6. Overall Vendor Dashboard — Payment

The overall payment dashboard shall show payments made to each vendor.

Element	Requirement
Chart	Bar/column chart recommended for vendor-to-vendor payment comparison.
X-axis	Vendor names.
Y-axis	Payment value.
Purpose	Compare payment distribution and identify vendors receiving the highest payments.

7. Single Vendor Dashboard — Payment

When a vendor is selected, the CRM shall display the payment history and payment trend for that vendor.

Element	Requirement
Vendor Selector	Select one vendor.
X-axis	Month/time period.
Y-axis	Payment value.
Purpose	Analyze payment patterns and payment history for the selected vendor.

8. Recommended Application Navigation

CRM → Dashboard, Vendors, Purchases, Payments, Reports.

Dashboard: Overall Purchase, Overall Payments, Vendor Summary, Financial Summary.

Vendors: Vendor List, Add Vendor, Vendor Details → Overview, Purchases, Payments, Balance, Analytics.

Purchases: All Purchases, Add Purchase, Purchase Details.

Payments: All Payments, Add Payment, Payment Details.

Reports: Purchase Reports, Payment Reports, Vendor Reports, Date-wise Reports.

9. Vendor Detail Page

The vendor detail page should provide a consolidated view containing vendor information, financial KPIs, purchase trend, payment trend, recent purchases and payment history.

Area	Displayed Information
Vendor Header	Vendor name, phone, state/city, last payment.
Financial KPIs	Total purchase value, total payments, outstanding balance.
Purchase Trend	Monthly/time-based purchase chart.
Payment Trend	Monthly/time-based payment chart.
Recent Purchases	Brand, model, quantity, unit price, total, date.
Payment History	Date, payment method, amount, attachment.

10. Core Business Logic

Purchase transaction: $\text{Vendor Balance} = \text{Previous Balance} + \text{Purchase Amount}$.

Payment transaction: $\text{Vendor Balance} = \text{Previous Balance} - \text{Payment Amount}$.

Example: Purchase █1,00,000 → Payment █40,000 → Outstanding █60,000. If another █20,000 is paid, the outstanding becomes █40,000.

11. Recommended Database Structure

A normalized relational structure is recommended so balances and analytics can be calculated from transaction records.

Entity	Key Fields
vendors	id, vendor_name, phone, state, city, created_at, updated_at
purchases	id, vendor_id, brand_name, model_name, quantity, purchase_date, unit_price, total_amount, attachment, created_at
payments	id, vendor_id, payment_date, payment_method, amount_paid, attachment, created_at

12. Dashboard Filters

Common filters should include date range and vendor selection. Date options: Today, This Week, This Month, Last Month, This Quarter, This Year and Custom Range. Transaction filters may include All, Purchases and Payments.

13. Recommended Enhancements

For a production-ready CRM, consider adding vendor search, pagination, transaction drill-down, Excel/PDF export, audit history, role-based access, approval workflows, document management, payment references/UTR, invoice numbers, GST/TDS fields where applicable, and notifications. These capabilities align with common vendor/procurement systems that centralize vendor records, purchases, bills, payments and outstanding balances.

14. End-to-End Workflow

Vendor Registration → Purchase Entry → Purchase Total Calculation → Payment Entry → Balance Update → Purchase/Payment Analytics → Reports.
